Exercises

Answer the questions or complete the tasks outlined in bold below, use the specific method described if applicable.

What is 7 to the power of 4?

In [10]: print(7**4)

Split this string:

s = "Hi there Sam!"

into a list.

In []:

In [8]: s="Hi there Saml"
 print(s.split())

['Hi', 'there', 'Sam!'] Given the variables:

planet = "Earth" diameter = 12742

Use .format() to print the following string:

hello

What is the main difference between a tuple and a list?

In []: List is dynamic while Tuple has static characteristics

Create a function that grabs the email website domain from a string in the form:

user@domain.com

So for example, passing "user@domain.com" would return: domain.com

In []:
In [12]: def convert(s):
 wmlist(s.split('g'))
 return w[1]
 s="user@domain.com"
 print(convert(s))
 domain.com

Create a basic function that returns True if the word 'dog' is contained in the input string. Don't worry about edge cases like a punctuation being attached to the word dog, but do account for capitalization.

Create a function that counts the number of times the word "dog" occurs in a string. Again ignore edge cases.

Problem

You are driving a little too fast, and a police officer stops you. Write a function to return one of 3 possible results: "No ticket". "Small ticket", or "Big Ticket". If your speed is 60 or less, the result is "No Ticket". If speed is between 61 and 80 inclusive, the result is "Small Ticket". If speed is 81 or more, the result is "Big Ticket". Unless it is your birthday (encoded as a boolean value in the parameters of the function) -- on your birthday, your speed can be 5 higher in all cases.

```
In [44]: def caught_speeding(speed, is_birthday):

if is_birthday:
    speeding = speed - 5
else:
    speeding = speed

if speeding > 80:
    return 'Big Ticket'
    else:
    return 'Small Ticket'
    print(caught_speeding(85,1))
    print(caught_speeding(85,0))
    print(caught_speeding(85,0))
    print(caught_speeding(85,0))

In [38]:

In [38]:
```

Create an employee list with basic salary values(at least 5 values for 5 employees) and using a for loop retreive each employee salary and calculate total salary expenditure.

```
In [42]: s=[100000,50000,40000,55000,25000]
for i in s:
print(i)

100000
50000
40000
55000
25000

Create two dictionaries in Python:
First one to contain fields as Empid, Empname, Basicpay

Second dictionary to contain fields as DeptName, DeptId.

Combine both dictionaries.

In [3]: d1=('Empid', 'Empname', 'Basicpay')
d2=('Deptname', 'Deptid')
print(a1|d2)

('Empid', 'Basicpay', 'Empname', 'Deptid', 'Deptname')

In [3]:
```
